Dessi Georgieva

AI Systems Engineer · Applied AI, Agents and Product Platforms

London, UK · dessi.georgieva8@gmail.com · LinkedIn · GitHub · Application evidence · AI Knowledge Hub

Profile

I build production AI systems with scoped tools, human approvals, and evaluation. At Publicis Media, I took a programmatic agent platform into production for agency teams. I am applying for OpenAI roles in London across applied AI, Codex agents, ads solutions, privacy, and integrity.

Professional Experience

Engineer

Publicis Media · London · Nov 2023 - Nov 2026

- I architected the production Programmatic agent platform used by internal agency teams across three major global advertiser accounts.
- I built configuration-driven advertiser onboarding and ingestion workflows that replaced spreadsheet-led enablement and removed at least three days of cross-team coordination per cycle.
- I designed the agent harness on AWS Bedrock AgentCore with Claude Agent SDK. Runtime controls governed tenant scope, approvals, evidence, and provider writes.
- I designed routing and correctness evaluations and used traces and metrics for grounding, tool use, latency, and cost to diagnose agent behaviour.
- I built API ingestion connectors and bronze, silver, and gold Databricks ELT pipelines. I designed production S3 landing, read-only staging access, and schema-based development reads using test data.
- I built Databricks-backed serving APIs and typed CLI routing between warehouse reports and live advertising APIs, including DV360 and The Trade Desk. I added schema, freshness, completeness, and reconciliation checks.
- I delivered backend services and cloud data workflows for an award-recognised ecommerce optimisation platform.
- I describe employer work only at responsibility and outcome level. Private code, clients, logs, and infrastructure remain confidential.

Senior Business Intelligence Analyst

Publicis Media · London · Mar 2023 - Nov 2023

- I turned recurring marketing reports into reusable datasets and decision-support services, building the API connectors and ELT pipelines that supplied them.

Business Intelligence Manager

Jellyfish · London · Jan 2021 - Mar 2023

- I built interactive analytics applications backed by ingestion connectors, cloud ELT pipelines, and marketing data lakes.

Data Consultant / SQL Developer / Data Analyst

Selected contracts · London · 2017 - 2020

- I delivered CRM, analytics, segmentation, and experimentation systems for agencies, startups, and media organisations, including ingestion connectors and ELT pipelines.

Selected Product and Engineering Work

Founder platform and product architecture

Human Systems Platform · Learning and opportunity research · First public product

- I am developing Human Systems Platform for evidence-backed learning and opportunity research. It connects private work history with owner-approved public profiles.
- I built evidence, approval, and publication components. The Opportunity Studio preview returns cited hypotheses from approved missions. Research remains manual.

- Learning Foundry and DG-OS are open source. The wider platform keeps personal evidence private.

Agent execution, policy, and recovery

Agentic Commerce Control Plane · Governed optimisation and learning for commerce · Public repository

- I built Agentic Commerce to test and improve product messaging for paid placements and agent-led discovery without giving AI unchecked control over business actions.
- I designed a Bayesian-style loop that updates brand- and product-scoped beliefs, recommends whether to promote, revise, or reject a variant, and keeps tools, evidence, memory, approvals, and recovery under explicit control.

Identity, delegated authority, and bounded execution

Gateplane Agent Control Plane · Independent beta for agent identity and execution · Product overview

- I built Gateplane to bind delegated authority to task-specific approvals, isolated workspaces, and scoped tools. Its controls also govern what evidence and outputs can be published.

Codex capabilities, evaluation, and provenance

Learning Foundry · Open-source learning with AI without confusing output with understanding · MIT-licensed repository

- I built an append-only evidence ledger, learning checks, and a consent-gated Codex adapter. The project began during OpenAI Build Week and develops human learning and agent capabilities separately.

Context construction, provider reliability, and agent UX

DG-OS Agent Runtime · Open-source public profiles and discovery · First live profile · AGPL-3.0-only repository

- I built DG-OS as Human Systems Platform's public profile and discovery module. Its runtime combines evidence retrieval, source-grounded answers, provider isolation, and streaming.

AI Engineering Capabilities

- **Harness architecture:** Design the environment around a model, including context, memory, tools, instructions, state, budgets, and interaction with surrounding systems.
- **Agent legibility:** Turn product goals, repository knowledge, interfaces, and feedback into structures that agents can inspect and follow.
- **Deterministic control:** Keep identity, permissions, approvals, tool scope, evidence, and consequential effects outside model authority.
- **Evaluation and improvement:** Test model behaviour, tool use, system interactions, and end results, then convert failures and feedback into reviewable changes.
- **Reliability and recovery:** Build explicit execution states, traces, receipts, retries, replay, fallback, cancellation, and recovery.
- **Human attention:** Decide when an agent should continue alone, ask for clarification, request approval, or surface uncertainty.
- **Data engineering:** Build API connectors, Databricks and AWS Glue ELT pipelines, and serving APIs. Check schema, freshness, completeness, and reconciliation.

Evidence Boundaries

- Public repositories demonstrate agent architecture, evaluation discipline, and product implementation; they do not establish production-scale Codex traffic.
- I do not claim model fine-tuning experience or a public coding-task solve-rate benchmark.
- Token cost, latency, capacity, and employer-system operational measurements are not publicly available.
- Current learning changes evidence, beliefs, memory, policy, and versioned harness configuration. It does not silently retrain or self-modify a foundation model.

Education

MA Applied Human Rights, University of York · 2009 - 2011

BA Philosophy (Philosophy of Science), Sofia University · 2003 - 2007
